for Vacuum \& Low Pressure Compressed Air

## THE BECKER TECHNICAL GUIDE and RULES OF THUMB HANDBOOK for VACUUM and LOW PRESSURE COMPRESSED AIR

This handbook has been compiled for the use of our distributors and customers as an aid in the designing of applications involving vacuum and low pressure compressed air. While every consideration has been made to ensure accurate information, errors may occur, and differences in interpretation may result in incorrect solutions; therefore, Becker Pumps Corporation assumes no responsibility for any application of these data.

## TABLE OF CONTENTS

(Items in blue are graphs)
Similarity of Units ..... 7
CFM -vs- SCFM -vs- ACFM ..... 8
Q (Throughput) ..... 9
SCFM to ACFM Conversion Ratios ..... 10, 11
Pressure Equivalents ..... 12, 13
Temperature Conversions ..... 14, 15
Conversion Factors ..... 16-18
Motor Cycling Guidelines ..... 19
Noise ..... 20-23
Duration of Exposure to Sound Levels ..... 21
Decibel Reduction
for Distance in a Free Field ..... 22
Adding Two Sound Levels ..... 23
Altitude -vs- Barometric Pressure ..... 24, 25
Altitude Correction for Regenerative Blowers ..... 26
Effects of Altitude on Air Compressors and Vacuum Pumps ..... 27
Holding Force of Round Suction Cups ..... 28
Holding Force of Square Suction Cups ..... 29
Vacuum System Sizing ..... 30
Conductance ..... 31
Receivers ..... 32
Pumpdown Calculations ..... 33
Pumpdown Time Correction Factors ..... 34, 35
Venting of Vacuum Vessels ..... 36, 37
Compressor Pump Up ..... 37
Critical Pressure Ratio Correction Factor ..... 37
Increasing Pump Capacity ..... 38
Receiver Volumes (Domed Heads) ..... 39
Leakage in Vacuum Systems ..... 40, 41
Permissable Dry Air In-leakage ..... 41
Calculating Air Leaks ..... 42
Using a Pump as a Flow Meter ..... 43
Orifice Flow Coefficients ..... 44, 45
Flow Through an Orifice-Vacuum ..... 46, 47
Flow Through an Orifice-Pressure ..... 48, 49
$\mathrm{C}_{\mathrm{v}}$ Ratings ..... 50, 51
Max. Flow for a Device with a $\mathrm{C}_{\mathrm{v}}$ of 1 ..... 52, 53
$C_{v}$ of Devices in Series ..... 54, 55
Combined Flow Coefficients ..... 55
Pipe Sizing Chart-Vacuum ..... 56, 57
Pipe Sizing Chart-Pressure ..... 58, 59
Effect of Pipe Length on Critical Ratio ..... 60, 61
Percent of Sonic Flow
at Supercritical Pressures ..... 62
Design Flow Velocity ..... 63
Friction Losses in Pipe Fittings ..... 64
Volume of Pipe ..... 65
Oil Capacity of "U" Series Pumps ..... 66
ISO and SAE Viscocity Grade Comparison ..... 67

460-370 B.C.
Demokritos started it all, when he concieved of the smallest particle that could not be divided: the atom (a, "not", tomos, "cut"), around which there should be only empty space, or nothing-a vacuum.
Used Oil Testing Limits ..... 68, 69
Vapor Pressure Table ..... 70, 71
Properties of Gases ..... 72, 73
Pumping Condensibles ..... 74
Gas Mixtures ..... 75
Water Vapor Pressure ..... 76
Vaporizing Water ..... 77
Lifting Fluids by Vacuum ..... 78
Adding Bleed Air to Control Inlet Temperature ..... 79
Laboratory Sizing ..... 80
Laboratory Use Factor Chart ..... 81
Hospital Sizing Criteria ..... 82-85
Hospital Simultaneous Use Factors ..... 84
Air Knife Sizing ..... 86, 87
Sizing of Spas and Hot Tubs ..... 88, 89
Sizing Blowers for Tank Agitation ..... 90, 91
Tank Ventilation ..... 91
Sparging Compressor Discharge Temperatures ..... 92
Water Temperature Correction Factors for Liquid Ring Vacuum Pumps ..... 93
Misc. Rules of Thumb ..... 94-97
Notes ..... 98-101

## SIMILARITY OF UNITS

Electricity, pressure, and vacuum have analogous units: force, current, resistance, conductance.

## Pressure \& Vacuum

In. Hg; Torr, etc. (Force-Pressure)

## CFM

(Current-Flow) The flow of a positive displacement pump is directly proportional to the pressure

Pressure Drop / Rise (Resistance- $\Delta \underline{P}$ )

## CFM

(Conductance)

## CFM -vs- SCFM -vs- ACFM

## CFM

Cubic Feet per Minute (displacement)
Total physical displacement of the pump chambers (swept volume) at $100 \%$ volumetric efficiency.

## SCFM

Standard Cubic Feet per Minute (mass flow)
Air at Standard Conditions of $68^{\circ}$ F, 29.92 in. $\mathrm{Hg}, 36 \%$ R.H., $0.075 \# / \mathrm{ft} .^{3}$

## ACFM

Actual Cubic Feet per Minute (volumetric flow)
Air that has been expanded in a vacuum (less dense)

Sometimes called CFM

## SCFM* to ACFM <br> Conversion Ratios

| Vacuum Level (in. Hg Vac) | Ratio (SCFM : ACFM) |
| ---: | :--- |
| 0 | $1: 1$ |
| 15 | $1: 2$ |
| 18 | $1: 2.5$ |
| 19 | $1: 2.75$ |
| 20 | $1: 3$ |
| 21 | $1: 3.33$ |
| 22 | $1: 3.75$ |
| 23 | $1: 4.28$ |
| 24 | $1: 5$ |
| 25 | $1: 6$ |
| 26 | $1: 7.5$ |
| 27.5 | $1: 12$ |
| 28 | $1: 15$ |
| 28.5 | $1: 20$ |
| 29 | $1: 30$ |
| 29.1 | $1: 33.3$ |
| 29.2 | $1: 37.5$ |
| 29.3 | $1: 42.86$ |
| 29.4 | $1: 50$ |
| 29.5 | $1: 60$ |
| 29.6 | $1: 75$ |
| 29.7 | $1: 100$ |
| 29.8 | $1: 150$ |
| 29.9 | $1: 300$ |

## PRESSURE EQUIVALENTS

| Torr | Absolute |  | relative (gauge) |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |

| 14.696 | 407.61 | 29.921 | 10353 | 760 | 1 |

$1 \mathrm{in} . \mathrm{H}_{2} \mathrm{O}=0.002487$ bar

* This is a unit conversion only. Some pressure terms may be absolute, some relative (gauge), and some may be either.

## FLOW CONVERSION

| CFM | $\mathbf{I} / \mathbf{s e c}$. | $\mathbf{m}^{3} / \mathbf{m i n}$. | $\mathbf{m}^{3} / \mathbf{h r}$. |
| :---: | :---: | :---: | :---: |
| 1 | 0.47195 | 0.02832 | 1.6990 |
| 2.1189 | 1 | 0.06 | 3.6 |
| 35.314 | 16.666 | 1 | 60 |
| 0.58861 * | 0.27778 | 0.01667 | 1 |

At 60 Hz . When converting from $\mathrm{m}^{3} / \mathrm{hr}$. to CFM, be aware of motor frequency. Many $\mathrm{m}^{3} / \mathrm{hr}$. ratings are at 50 hz , while most CFM ratings are at 60 hz .

If the conversion is from $\mathrm{m}^{3} / \mathrm{hr}$. at 50 hz . to CFM at 60 hz the factor is 0.7063 .

| VELOCITY |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| FT./ <br> SEC. | FT./ <br> MIN. | CM/ <br> SEC. | METER/ <br> SEC. | METER/ <br> MIN. |
| 1 | 60 | 30.48 | 0.3048 | 18.29 |
| 0.01667 | 1 | 0.5080 | 0.005080 | 0.3048 |
| 0.03281 | 1.9685 | 1 | 0.01 | 0.600 |

1 horsepower = 2546 BTU/hr.
3 ph. HP $=\frac{\text { Volts } \times \text { Amps } \times \text { eff. } \times \text { P.F. } \times 1.732}{746}$
1 ph. HP $=\frac{\text { Volts } \times \text { Amps } x \text { eff. } \times \text { P.F }}{746}$

## MOTOR CYCLING GUIDELINES

Electric motors* have specific NEMA guidelines for the number of starts per hour and the period between stops and starts they can tolerate.

## NOISE

The sound pressure level, or noise, is measured on an exponential scale. An increase of 3 dB is a doubling of the noise. A 10 dB increase is 10 times noisier; 20 dB is 100 times noisier.

It takes a 3 dB sound level increase in order for it to be perceptable to the human ear.

## Exposure to different noise levels.

Exposure to different noise levels at different times requires that the sum of the exposure time percentages (actual time at each sound level divided by the permissible time at each sound level) cannot exceed unity (1). For example:

| Exposure during | Permissible | Exposure time |
| :---: | :---: | :---: |
| 8 hour day: | exposure: | percentages: |
| 3 hrs. @ 85dBA | unlimited | 0 |
| 4 hrs. @ 92dBA | 6 hours | $4 / 6=0.66$ |
| 1 hrs. @ 95dBA | 4 hours | $\underline{1 / 4=0.25}$ |
|  |  | Total $=0.91$ |

Since the total does not exceed 1, protection is not required. If it exceeds 1, protection is required.

DURATION OF EXPOSURE TO SOUND LEVELS

## DECIBEL REDUCTION

For distance in a free field

## ADDING TWO SOUND LEVELS

Correction to be Added to Higher Sound Level (dB)

## ALTITUDE -vs- <br> BAROMETRIC PRESSURE

| ALTITUDE | BAROMETRIC <br> (Feet) | ALTITUDE <br> (in. Hg) | BAROMETRIC <br> (Feet) |
| :---: | :---: | :---: | :---: |
| 0 | 29.92 | 2700 | 27.11 |
| PRESSURE |  |  |  |
| (in. Hg) |  |  |  |$|$

To determine the equivalent sea level pressure (\%):

$$
P_{S L}=\frac{\left(P_{B}-V\right) 29.92}{P_{B}}
$$

$P_{S L}=$ Sea level reference pressure (in. Hg Abs.)
$P_{B}=$ Barometric Pressure at altitude (in. Hg Abs.)
$\mathrm{V}=$ Operating vacuum level at altitude (in. Hg )

To determine the equivalent sea level flow:

$$
Q_{S L}=Q_{O} \times \frac{29.92}{P_{B}} \quad Q_{O}=\frac{Q_{S L}}{\frac{29.92}{P_{B}}}
$$

$Q_{S L}=$ Sea level airflow (SCFM)
$Q_{0}=$ Airflow at altitude (SCFM)
$P_{B}=$ Barometric Pressure at alt. (in. Hg Abs ., or PSIA)

NOTE: When selecting pumps for operation at high altitudes, it is often necessary to use motors with larger horsepower due to the inefficiencies of cooling fans, etc. Contact the motor manufacturer for specific details and technical help.
"We live submerged at the bottom of an ocean of air" Evangelista Torricelli, CA 1644

## ALTITUDE CORRECTION FOR REGENERATIVE BLOWERS

A given percentage decrease in density due to altitude, equals the same percentage decrease of pressure, but the same ACFM.

$$
\begin{aligned}
& \text { i.e., A blower that produces } 110 \mathrm{ACFM} \\
& \text { at } 40 \mathrm{in} . \mathrm{H}_{2} \mathrm{O} \text { at sea level }=110 \mathrm{ACFM} \text { at } \\
& 35.72 \mathrm{in} . \mathrm{H}_{2} \mathrm{O} \text { at an altitude of } 3000 \text { feet } \\
& (26.62 \mathrm{in} . \mathrm{Hg} \text { Bar. Pr.): } \\
& \text { [ } 40 \times 0.107=4.28 ; 40-4.28=35.72 \text { ] }
\end{aligned}
$$

## Density Change

@ $1,000 \mathrm{ft} .=-3.8 \%$
@ $2,000 \mathrm{ft} .=-7.4 \%$
@ $3,000 \mathrm{ft} .=-10.7 \%$

Equivalent Dia. $=1.128 \sqrt{\mathrm{a}}$; where: $\mathrm{a}=\operatorname{area}\left(\mathrm{in} .^{2}\right)$

## VACUUM SYSTEM SIZING

## MULTIPLEX SYSTEMS

The majority of central vacuum systems are designed with redundancy included. The following method is the most common.

The Peak Calculated Load (PCL) is the maximum anticipated load the sysem is expected to meet.

## DUPLEX

Each pump is sized for $100 \%$ of PCL

## CONDUCTANCE (C)

Conductance (C) is the reciprocal of resistance, or pressure drop ( $\Delta \mathrm{P}$ ), expressed in terms of volumetric flow. When designing a system, the calculated conductance should be at least ten times the ACFM (i.e., if the volumetric flow at the operating pressure is 150 ACFM, the conductance of the system should be at least 1500 ACFM).

Conductance of components in series:

$$
\frac{1}{\mathrm{C}}=\frac{1}{\mathrm{C}_{1}}+\frac{1}{\mathrm{C}_{2}}+\frac{1}{\mathrm{C}_{3}} \cdots
$$

Conductance of components in parallel:

$$
C=C_{1}+C_{2}+C_{3} \ldots
$$

$$
\begin{aligned}
& C=\frac{Q}{\Delta P} \\
& Q=C \cdot \Delta P \\
& \Delta P=\frac{Q}{C}
\end{aligned}
$$

1660
Otto von Guericke demonstrates the power of the force of atmospheric pressure in Magdeburg. A vacuum was created in two close fitting hemispheres, and two teams of horses could not pull them apart. When a valve was opened, the hemispheres fell apart.

## RECEIVERS

Sizing a receiver to equalize pressure

$$
V_{1 \mathrm{~b}}=\frac{\left(\mathrm{V}_{1 \mathrm{a}} \times \mathrm{P}_{1 \mathrm{a}}\right)-\left(\mathrm{V}_{1 \mathrm{a}} \times P_{2}\right)}{P_{2}-P_{1 \mathrm{~b}}}
$$

Calculating the final equalized pressure $\left(\mathrm{P}_{2}\right)$

$$
P_{2}=\frac{\left(P_{1 \mathrm{a}} \times V_{1 a}\right)+\left(V_{10} \times P_{1 b}\right)}{V_{1 b}+V_{1 \mathrm{~b}}}
$$

Where: $\quad P_{1}=$ Initial pressure (Torr)
$P_{2}=$ Final, equalized pressure (Torr)
$\mathrm{V}_{1}=$ Initial volume $\left(\mathrm{ft}^{3}\right)$
subscript a = high pressure (low vacuum) chamber subscript $\mathrm{b}=$ low pressure (high vacuum) chamber

## PUMP DOWN CALCULATIONS

To find the required pump speed (ACFM):

$$
S=\frac{V}{T} \ln \frac{P_{1}}{P_{2}} \quad \text {-or- } \quad S=2.3 \frac{V}{T} \log \frac{P_{1}}{P_{2}}
$$

To find the time required:

$$
T=\frac{V}{S} \ln \frac{P_{1}}{P_{2}} \quad \text {-or } \quad T=2.3 \frac{V}{S} \log \frac{P_{1}}{P_{2}}
$$

To find the volume of a system:

$$
\left.V=\frac{S T}{\ln \left(P_{1} / P_{2)}\right)}\right) \text {-or- }\left(V=\frac{S T}{2.3 \log \left(P_{1} / P_{2)}\right.}\right.
$$

Where: $\quad V=$ Volume of system $\left(\mathrm{ft}^{3}\right)$ P1 = Initial—high—pressure (Torr) P2 = Final—low—pressure (Torr) T = Pump down time (minutes) S = Pump speed, or capacity (average ACFM from $\mathrm{P}_{1}$ to $\mathrm{P}_{2}$ )

## PUMPDOWN TIME CORRECTION FACTORS*

| From Atm. Press. to: | Pump Type/Ultimate Vacuum (Torr) |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |

| 85 | 1.734 | 1.284 | 1.058 |  | $\stackrel{\square}{\triangle}$ |

* Factors due to effect of ultimate vacuum on performance curve.

## COMPRESSOR PUMP UP

To find the required compressor capacity, or time:

$$
A C F M=\frac{\left(V\left(P_{2}-P_{1}\right)\right) / T}{P_{0}}
$$

$$
T=\frac{V\left(P_{2}-P_{1}\right)}{P_{0}(A C F M)}
$$

Where: $V=$ Receiver or System Volume ( ft 3 )
$T=$ Time from $P_{1}$ to $P_{2}$ (minutes)
$\mathrm{P}_{\mathrm{O}}=$ Atmospheric Pressure (PSIA)
$P_{1}=$ Initial Pressure (PSIA)
$\mathrm{P}_{2}^{1}=$ Final Pressure (PSIA)

## VENTING OF VACUUM VESSELS

Venting from One Absolute Pressure to an Intermediate Absolute Pressure (other than atmospheric):

$$
\mathrm{t}=.28 \frac{\mathrm{~V}}{\mathrm{~d}^{2}}\left(\mathrm{R}_{2}-R_{1}\right)
$$

Note: For $\mathrm{R}_{\mathrm{n}}$ factors, see graph below

Where:
$\mathrm{t}=$ Time (seconds)
$\mathrm{V}=$ Vessel volume (cu. ft.)
$\mathrm{d}=$ Diameter of opening (inches)
$P_{o}=$ Abs. pressure on outside of vent valve (Torr)
$P_{1}=$ Initial absolute pressure in vessel (Torr)
$P_{2}=$ Final absolute pressure in vessel (Torr)

$$
\mathrm{R}_{\mathrm{n}}=\text { Corrected ratio }
$$

Pressure Ratio, $\mathrm{P}_{\mathrm{n}} / \mathrm{P}_{\mathrm{o}}$

## CRITICAL PRESSURE RATIO

 Correction Factor
## RULE OF THUMB

To reduce the absolute operating pressure by half, requires twice the pump capacity.

To pump the same load in half the time, requires twice the pump capacity.

## INCREASING PUMP CAPACITY

To increase flow while maintaining the same ultimate pressure, place pumps in parallel.

To decrease the ultimate pressure while maintaining the same flow, place pumps in series (flow will be determined by the first pump in the series).

To increase both flow and ultimate pressure, place a rotary lobe (Roots-type) positive displacement blower as the first pump in a series with a Dekatorr type F pump.
"What is there in a vacuum that could make them afraid?" Blaise Pascal, CA 1648

## RECEIVER VOLUMES

(With Domed Heads)

## LEAKAGE IN VACUUM SYSTEMS

The following equation can be used to determine the amount of air in-leakage in vacuum systems:

$$
\mathrm{L}=\frac{0.15 \times \mathrm{Vx}\left(\mathrm{P}_{2}-\mathrm{P}_{1}\right)}{\mathrm{T}}
$$

Where: $\quad L=$ Leakage (lbs./hr.)

$$
\mathrm{V}=\text { Volume }\left(\mathrm{ft} .^{3}\right)
$$

$$
\mathrm{P}_{1}=\text { Starting pressure (in. Hg Abs.) }
$$

$$
\mathrm{P}_{2}=\text { Ending Pressure (in. Hg Abs.) }
$$

$$
\mathrm{T}=\mathrm{Time}(\min .)
$$

The maximum recommended allowable in-leakage of atmospheric air, when designing a vacuum system, may be determined by the following methods:

| Inlet Pressure Range |  | Pumping Speed <br> Multiplier |
| :---: | :---: | :---: |
| Torr | In. Hg Abs. |  |
| $760-100$ | $29.92-4$ | 1.25 |
| $100-10$ | $4-0.4$ | 1.5 |
| $10-0.5$ | $0.4-0.02$ | 2.0 |
| $0.5-0.05$ | - | 4.0 |
| $0.05-0.0005$ | - |  |

## CALCULATING AIR LEAKS

To determine the amount of air in-leakage in an existing vacuum system, the following equation may be used:

$$
\mathrm{Q}=\frac{\mathrm{P} \bullet \mathrm{~V}}{\mathrm{~T}}, \text { or, TorrACFM }
$$

If the system volume $\left(\mathbf{V}=\mathrm{ft} .^{3}\right)$ is known, monitor the time ( $\mathbf{T}=\mathrm{min}$.) it takes for the pressure ( $\mathbf{P}=$ Torr) to rise from the starting absolute pressure to the final absolute pressure, using the difference in pressure (i.e., $P=100-35=65$ ).

Do not exceed 400 Torr.
To determine the amount of in-leakage (ACFM) at the operating pressure, divide "Q" by the operating pressure (Torr).

For an explanation of "Q", see page 9.
For an alternative equation see page 40.
For an easy way to find vacuum leaks, wrap Saran Wrap ${ }^{\text {TM }}$, or other "sticky" plastic kitchen wrap, around pipe fittings. It will draw in if a leak is present.

## USING A PUMP AS A FLOW METER

(Based on the principle that all* positive displacement pumps have linear mass flow curves).

- Set any pump control switches to "manual", or, if none are used, place jumpers across the vacuum switch contacts. The pumps must not cycle on and off during this test. Only run one pump.
- Close the isolation valve at the inlet of the pump and measure the best (ultimate) vacuum it can produce. Use a good quality pressure gauge.
- Open the isolation valve and let the pump run until the vacuum reaches a stable level (does not rise or fall).
- Refer to the performance curve for the pump and read the flow produced at the vacuum level at which the system stabilized.

This is the total flow for the entire system at that moment. Monitor it using the same method at different times during the day and during different days to establish variations in the requirements. Note that some manufacturers rate their pumps in ACFM, while others rate theirs in SCFM. The equations on page 9 can be used to convert from one to the other.

[^1]
## ORIFICE FLOW COEFFICIENTS

The shape of an orifice determines the amount of gas that can pass through it. Gas flow (SCFM) increases from atmospheric pressure until it reaches sonic (speed of sound) velocity, which occurs at a pressure ratio (upstream pressure to downstream pressure) of 1:0.528 (approximately 400 Torr with atmospheric pressure on the upstream side of the orifice).

$$
\begin{gathered}
\mathrm{C}=\text { Flow Coefficient } \\
\mathrm{F}_{\mathrm{c}}=\text { Correction Factor* }
\end{gathered}
$$

* To be applied to the charts on pages 46-49.

NOTE: Dirt buildup on the edge of the orifice will affect the flow coefficient.

When air flows through an orifice and the diameter is constant, the pressure will vary as the

$$
\frac{P}{P_{1}}=\frac{V^{2}}{V_{1}{ }^{2}}
$$ square of the flow:

When the pressure is constant, the flow will vary as the square of the diameter:

$$
\frac{\mathrm{V}}{\mathrm{~V}_{1}}=\frac{\mathrm{D}^{2}}{\mathrm{D}_{1}{ }^{2}}
$$

When the flow is constant, the pressure will vary inversely as the fourth power of the

$$
\frac{P^{P}}{P_{1}}=\frac{D_{1}^{4}}{D^{4}}
$$ diameter:

Doubling the orifice diameter, quadruples the $\mathrm{C}_{\mathrm{v}}$

$$
\begin{aligned}
& D_{\text {eff }}=\sqrt{\frac{C_{v}}{18}} \\
& C_{v}=18 d^{2}
\end{aligned}
$$

Where: $\mathrm{D}_{\text {eff }}=$ Effective orifice diameter (in.)

Where: $\quad T_{1}={ }^{\circ} R$
$\mathrm{G}=$ Specific Gravity, 1
(for Air)
$\Delta \mathrm{P}=$ Pressure drop across the orifice

$$
\begin{aligned}
\mathrm{P}_{2}= & \text { Downstream } \\
& \text { Pressure (Torr) }
\end{aligned}
$$

$\mathrm{C}_{\mathrm{v}}$ and SCFM are directly proportional

1660
Robert Boyle creates "Boyle's Law", $P_{1} V_{1}=P_{2} V_{2}$. wherein, at a constant temperature, a volume of air varies with pressure according to it's inverse proportion.

## USING THE C ${ }^{\text {v }}$ GRAPH

1. Determine the $C_{v}$ for the device (valve or orifice). (See page 46 for $C_{v}$ values for orifices)
2. Correct the $C_{v}$ for use with the chart at the right $\left(C_{v}=1\right)$.
3. Correct the SCFM for use with this chart.
4. Read down from Downstream Pressure, $\left(P_{2}\right)$ (vertical) line to the corrected SCFM (horizontal) line. The curved line will be the upstream operating pressure $\left(P_{1}\right)$ for the original device, because:

Example 30 SCFM at 200 Torr

$$
\begin{gathered}
\mathrm{P}_{2}=200 \text { Torr } \\
\mathrm{C}_{\mathrm{v}}=10.125 \\
\frac{1}{10.125}=0.0988
\end{gathered}
$$

$$
0.0988 \times 30=2.96
$$

$P_{1}=275$ Torr
therefore:
$\Delta \mathrm{P}=75$ Torr
$C_{v}$ and SCFM are directly proportional.

See page 51 for details.

## $\mathrm{C}_{\mathrm{v}}$ OF DEVICES IN SERIES

## To determine the combined flow coefficient of two devices in series:

- Read up from the $\mathrm{C}_{\mathrm{v}}$ of the first device to the intersection of the curved line indicating the $\mathrm{C}_{\mathrm{v}}$ of the second device.
- Read left to find the resultant combined $\mathrm{C}_{\mathrm{v}}$ of the two devices in series.

#### Abstract

If there are more than two devices in series, the total combined $\mathrm{C}_{\mathrm{v}}$ of the system can be found by taking any two devices as a sub-system and determining their combined $\mathrm{C}_{v}$, which may then be combined with the next device in the series, and so on.

To determine the resultant flow coefficient when one device is removed from a series of devices:

- Read right from the combined $\mathrm{C}_{\mathrm{v}}$ of the devices in series to the curved line representing the $\mathrm{C}_{\mathrm{v}}$ of the device being removed.
- Read down to the resultant $\mathrm{C}_{\mathrm{v}}$ of the remaining portion of the system.

## HOW TO USE THE PIPE SIZING CHART

- Read from the SCFM required at the operating pressure on the left scale, or for lbs./hr. at the operating pressure on the right side of the scale, to the diagonal line indicating the operating pressure.
- The closest diagonal pipe size line above the intersecting point is the first estimate for the appropriate pipe size. This will apply to lines about 100 to 150 feet long.
- To determine the estimated pressure rise $(\Delta \mathrm{P})$ for the selected pipe, find the intersection for the pipe size and the SCFM (or lbs./hr.) flow rate. This will usually be slightly different from the point in step 1.
- Read down to the $\Delta \mathrm{P}_{760}$ number. This is the $\Delta \mathrm{P}$ at 760 torr and must be corrected for the actual operating pressure $\left(\mathrm{P}_{\mathrm{o}}\right)$.
- Multiply this number by the equation below (right) to read the $\Delta \mathrm{P}$ at $\mathrm{P}_{\mathrm{o}}$.
- If the $\Delta \mathrm{P}$ for all sections of pipe between the pump and the point of use exceeds $10 \%$ of the absolute operating pressure, select the next larger size pipe and recalculate. Be sure to include the $\Delta \mathrm{P}$ through all devices in the system (i.e., filters, valves, etc.).
- ACFM may be calculated from the equation below (left)

Where: $\quad P_{0}=$ Operating Pressure (torr) ;

$$
\Delta \mathrm{P} \text { at } \mathrm{P}_{\mathrm{o}}=\Delta \mathrm{P}_{760} \times \frac{760}{\mathrm{P}_{\mathrm{o}}} \times \frac{\mathrm{T}_{\mathrm{o}}+460}{530}
$$

$\mathrm{T}_{\mathrm{O}}=$ Operating Temperature ( ${ }^{\circ} \mathrm{F}$ )

## HOW TO USE THE PIPE SIZING CHART

1. Read from SCFM at the left over to the desired pipe size (diagonal lines).
2. Read down to the $\Delta \mathrm{P}_{\text {Atm }}$ at the bottom of the chart.
3. Calculate the actual $\Delta P$ based on the air density at the operating pressure.

Data based upon air flow through schedule 40 steel pipe.

Air density of $0.075 \mathrm{lbs} . / \mathrm{ft}^{3}$.
"For the air-pump weakens and dispirits, but cannot wholly exhaust"
Christopher Smart, Jubilate Agno, 1759

Friction loss is directly proportional to air density.

## Using the Graph

A long length of the pipe increases the resistance to flow due to friction between the air and the pipe wall. This flow resistance paradoxically increases flow velocity until the critical ratio (downstream absolute pressure divided by the upstream absolute pressure) is reached, at which sonic velocity occurs, depending on pipe length and pressure difference. Unlike an orifice, where the length is shorter than the diameter, and a nozzle, both of which where the critical ratio is constant, in piping the critical ratio is not constant, but decreases as pipe length increases.

The graph at the right illustrates the effect that the adjusted pipe length (Lf/d) has on the critical pressure ratio $\left(R_{c}\right)$. The friction factor (f) will vary with the pipe surface roughness, pipe diameter and Reynolds number*.

$$
\begin{aligned}
\text { Where: } & L=\text { Pipe length }(\mathrm{ft} .) \\
& \mathrm{f}=\text { friction factor, }(0.02) \\
& \mathrm{d}=\text { pipe diameter }(\mathrm{ft} .)
\end{aligned}
$$

## PUMPING CONDENSIBLES

1-Determine the temperature $\left(T_{\mathrm{vI}}\right)$ of the vapor at the inlet of the pump.
2-Determine the vapor pressure $\left(\mathrm{P}_{\mathrm{vi}}\right)$ of the gas at its temperature at the inlet of the pump (use a vapor pressure table).
3-Estimate the pressure $\left(\mathrm{P}_{0}\right)$ at which you will be bleeding in the sweep gas (dry air). This will be the actual operating pressure of the process.
4-Calculate the maximum percentage of the gas.

$$
\frac{P_{\mathrm{vI}}}{\mathrm{P}_{\mathrm{o}}} \times 100=\% \text { Max. }
$$

5-Determine the maximum discharge pressure $\left(P_{D}\right)$ the gas will see. This should be the maximum back pressure on the exhaust filters, stated in Torr (i.e., 3 PSIG is $3 \times 51.55+760$ = 915 Torr).
6-Determine the partial pressure $P_{P D}$ of the gas at the discharge:

$$
P_{D} \times \frac{\% M a x}{100}=P_{P D}
$$

7-Referring to the vapor pressure chart for the water, find the temperature that corresponds to the partial pressure $\left(\mathrm{P}_{\mathrm{PD}}\right)$ of the gas at the discharge.

This is the temperature at which you need to keep the oil and the exhaust box to prevent condensation.

## GAS MIXTURES

WHERE: $\quad \mathrm{W}_{\mathrm{T}}=$ Total Gas Weight (\#/hr.)
$\mathrm{MW}_{1} \ldots \mathrm{MW}_{\mathrm{N}}=$ Molecular Weight of Gas Component
$\mathrm{W}_{1} \ldots \mathrm{~W}_{\mathrm{N}}=$ Weight of Gas Component
$\mathrm{MW}_{\text {AvG }}=$ Average Molecular Weight
$\mathrm{P}_{\mathrm{o}}=$ Operating Pressure (Torr)
$\mathrm{T}_{\mathrm{O}}=$ Operating Temperature $\left({ }^{\circ} \mathrm{F}\right)$

## DID YOU KNOW?

If you removed one million molecules every second from those contained in a single cubic inch of air at atmospheric pressure:

It would take 140 million years
to remove all the molecules!

WATER VAPOR PRESSURE

## VAPORIZING WATER

The rate of evaporization is limited by the heat input.
The heat per unit of weight required to cause a transition from liquid to vapor is called the Latent Heat of Vaporization

The liquid's vapor pressure will be the limit of vacuum until the liquid has been totally evaporated.

The quantity of heat required to evaporate a given weight of water can be calculated by multiplying the Latent Heat of Evaporization by the weight of the water.

| Latent Heat of Vaporization for Water |  |  |  |
| :---: | :---: | :---: | :---: |
| Temp. ${ }^{\circ} \mathrm{C}$ | Btu/lb. | Temp. ${ }^{\circ} \mathbf{C}$ | Btu/lb. |
| 0 | 597.12 | 60 | 563.44 |
| 10 | 591.86 | 70 | 557.47 |
| 20 | 586.13 | 80 | 551.50 |
| 30 | 580.63 | 90 | 545.29 |
| 40 | 574.90 | 100 | 539.08 |
| 50 | 569.17 |  |  |

Evaporate 20\# of water in 10 minutes at 50 torr @ $80^{\circ} \mathrm{C}$
ACFM $^{*}=20 \times 379 / 18 \times 760 / 50 \times[(460+176) / 530] \times 1 / 10$

* See Page 9

Heat Required: $20 \times 551.50$
Heat Transfer Rate: 11030/10-1103 Btu/Min.

## LIFTING FLUIDS BY VACUUM

Using Specific Gravity (S.G.) to determine lift.
Since water has a specific gravity of 1 , and atmospheric pressure is 406.8 in. $\mathrm{H}_{2} \mathrm{O}\left(33.9\right.$ feet $\left.\mathrm{H}_{2} \mathrm{O}\right)$, divide 406.8 by the S.G. of the fluid to be lifted to get the pressure of the atmosphere in terms of the fluid.

Divide the distance to be lifted by the atmospheric pressure of the fluid to get the percentage of atmospheric pressure required to lift the fluid.

Multiply the percentage by the atmospheric pressure in your working term (torr; in. Hg ; etc.) to get the necessary differential pressure to lift the fluid.

Lift molten aluminum 48 inches into a mold
Solution
Aluminum S.G. $=2.708$
$406.8 / 2.708=150.22$ in.AI
$48 / 150.22=0.32 \mathrm{Atm}$.
$0.32 \times 29.92 \mathrm{in} . \mathrm{Hg}=9.54 \mathrm{in} . \mathrm{Hg}$ Vac
$9.54 \mathrm{in} . \mathrm{Hg}$
is needed to lift molten aluminum 48 inches

Be sure to provide adequate protection at the inlet of the pump (knock-out-pots, heat exchangers, etc.)

## ADDING BLEED AIR TO CONTROL INLET TEMPERATURE

When a process includes inlet gas at a temperature higher than that specified as maximum for a pump, the temperature must be reduced to a point at or below that limit. Air (or other gas) can be admitted into the inlet airstream in order to cool the hot process gases, via dilution.

## Where:

$$
V=\frac{(A B)-(D B)}{(D-C)}
$$

A = Process (hot) Air Temperature ( ${ }^{\circ} \mathrm{F}$ )
$\mathrm{B}=$ Process Air Flow (air equivalent SCFM)
$\mathrm{C}=$ Bleed Air Temp ( ${ }^{\circ} \mathrm{F}$ )
D = Final Desired Inlet Air Temperature ( ${ }^{\circ} \mathrm{F}$ )
V = Air Equivalent SCFM Needed for Bleed Air

## LABORATORY SIZING

## LABORATORY USE FACTOR CHART

| No. of Terminals |
| :---: |
| $1-5$ |
| $6-8$ |
| $9-12$ |
| $13-20$ |
| $21-35$ |
| $36-80$ |
| $81-160$ |
| $161-280$ |
| $281-500$ |
| $501-1000$ |
| $1001-2200$ |
| $2201-5000$ |
| $5001+$ |

Use Factor
100\%
90\%
80\%
70\%
60\%
50\%
40\%
35\%
30\%
25\%
20\%
15\%
$10 \%$

Sizing is based on 0.5 SCFM per terminal at the operating pressure.

When calculating pressure drop in laboratory piping systems, the use factor should be applied to the total number of terminals that are connected to the upstream side (farthest away from the pump) of that branch of pipe.

## BECKER HOSPITAL SIZING CRITERIA

## Usage Group A Terminals

## Usage Group B Terminals

| Location | Recommended <br> No. of Terminals |
| :---: | :---: |
| Patient Rooms <br> (Medical and Surgical) | 1 (Accessable to each bed) |
| Exam and Treatment Rooms <br> (Med., Surg., Postpartum Care) | 1 |
| Isolation (Infectious, Protective; Med., Surg.) |  |
| Security Room (Med., Surg., Postpartum) | 1 |
| Newborn Nursery (Full-Term) | 1 |
| Pediatric Nursery | 1 |
| Pediatric and Adolescent | 1 |
| Seclusion Treatment Room | - |
| Anesthesia Workroom | - |
| Outpatient Recovery | 3 |
| Labor/Delivery/Recovery/Postpartum(LDRP) | 2 |
| Postpartum Bedroom | 1 |
| Labor Room | 1 |
| Initial Emergency Management | 1/Bed |
| Orthopedic and Cast Room | 1 |
| Autopsy Room | 1/Workstation |
| Catheterization Labs | 2 |
| Surgical Excision Room | 1 |
| Dialysis Units | 0.5/Bed |
| Respiratory Care | Convenience |
| Central Supply | Convenience |
| Equipment Repair, Calibration | Convenience |
| Teaching | Convenience |
| -8 |  |

## BECKER HOSPITAL SIZING CRITERIA

Note: NFPA 99 no longer recommends hospital sizing criteria. It is the responsibility of manufacturers and engineering organizations to determine proper pump sizing. This method is based on many years of experience, and incorporates capacity for recent equipment and usage developments.

## SIMULTANEOUS USE FACTOR CURVES

## AIR KNIVES

Design considerations:
Velocity
Slot size
Manifold size

## VELOCITY

- Velocity depends on such factors as distance of air knife from the product, surface tension of the liquid, weight, and stability of the product.
- Velocity requirements may vary from 4000 FPM to over 20,000 FPM. The following equation may be used to determine velocity.

$$
\mathrm{V}=\frac{576 \times \text { SCFM }}{\pi \mathrm{D}^{2}}
$$

Where: $\mathrm{D}=$ Diameter of hole equal to total slot area.

## SLOT SIZE

- A properly sized slot has a depth $\left(\mathrm{D}_{\mathrm{s}}\right)$ to width (W) ratio of about 6:1.
- The length of the slot, relative to its width, should have a ratio between $1: 100$ to 200 for stability (i.e., a ${ }^{1 /} /{ }_{16}$ " wide slot should be between 6 " to 1' long).

## MANIFOLD SIZE

- The area of the manifold should be approximately twice that of the total slot area. The following equation may be used to determine manifold I.D.

$$
D=2 \sqrt{\frac{a}{\pi}}
$$

Where: $\quad \mathrm{a}=$ Total area of slot
$D=$ Inside diameter of pipe or manifold

## SIZING of SPAS and HOT TUBS

1- Determine the number of jets or orifices in the spa.

2- Calculate the total area of all the orifices: Total area $=($ No. of holes $) \times \pi \times$ radius $^{2}$

3- Select the proper blower from the following chart:

Find the number and size of the orifices (jets) in the spa. Read left to determine the proper Becker blower (Do not exceed the maximum water depth for the blower)

| Orifice Area |  |
| :---: | :---: |
| Orifice Dia. | Area $\left(\mathrm{in}^{2}\right)$ |
| $1 / 8^{11}(0.125)$ | 0.012 |
| $5 / 32^{\prime \prime}(0.156)$ | 0.019 |
| $31^{16}(0.188)$ | 0.028 |
| $7 / 32110.219)$ | 0.038 |
| $1 / 4_{4}^{11}(0.250)$ | 0.049 |

| Blower Selection Chart |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| SV Model | Max. water depth | No. of Jets | Orifice dia. | Min. no. of Orifices* | Min. total hole area ( $\mathrm{in}^{2}$ ) |
| 7.130/1 | 30" | 3-5 |  | 55 40 26 20 16 | 1.0 |
| 7.190/1 | 36" | 5-10 |  | 77 55 36 28 23 | 1.125 |
| 5.250/1 | 42" | 7-12 |  | $\begin{aligned} & 85 \\ & 60 \\ & 40 \\ & 31 \\ & 25 \end{aligned}$ | 1.188 |
| 7.330/1 | 48" | 12-18 | $\begin{aligned} & 1 / 8^{11} \\ & 5 / 8^{\prime \prime} \\ & 3 / 1{ }^{111} \\ & 7 / 321 \\ & 1 /{ }^{111} \end{aligned}$ | $\begin{gathered} 119 \\ 82 \\ 55 \\ 42 \\ 34 \end{gathered}$ | 1.625 |

* Fewer orifices may cause excessive back pressure on the blower. Use of a pressure relief valve is recommended.

## SIZING BLOWERS FOR TANK AGITATION

Becker regenerative blowers are used for tank agitation in applications such as plating tanks, cleaning tanks, and rinsing tanks. Both pressure and flow requirements must be calculated.

## Pressure Requirements

$$
P=0.43 \mathrm{D} \mathrm{~S}+0.75
$$

Where:

$$
\begin{aligned}
& P=\text { Pressure }(P S I G) \\
& D=\text { Solution Depth (feet) } \\
& S=\text { Specific Gravity of Solution (see table) }
\end{aligned}
$$

## Flow Requirements

$$
Q=A \cdot F
$$

## Where:

$\mathrm{Q}=$ Flow Rate (SCFM)
A = Tank Surface Area (ft²)
$\mathrm{F}=$ Agitation Factor (SCFM/ft², see table)

| Blower Selection Chart |  |  |
| :---: | :---: | :---: |
| Solution | Agitation Factor (F) <br> $($ SCFM/ft²) | Specific <br> Gravity (D) |
| Al Plating | $1.0-1.8$ | 1.2 |
| Cu Plating | $1.0-1.5$ | 1.2 |
| Ni Plating | $1.2-2.0$ | 1.2 |
| Cleaning | $1.0-1.5$ | 1.1 |
| Rinsing | $0.5-1.5$ | 1.0 |

## TANK VENTILATION

(Sizing blowers for ventilation of plating tanks)
Air is blown across the tank surface to carry the fumes to an exhaust system.

Air flow $=1$ SCFM at 1 PSIG / foot of tank length

Orifices should be sized to provide an area equal to a $1 / 8$ " diameter orifice ( $0.012 \mathrm{in}^{2}$ ) per foot of pipe.

## SPARGING COMPRESSOR DISCHARGE TEMPERATURE

## WATER TEMPERATURE CORRECTION FACTORS

## For Liquid Ring Vacuum Pumps

The following graph shows a typical correction factor for the performance of liquid ring vacuum pumps due to the effect of water vapor pressure. The standard is $60^{\circ} \mathrm{F}$; colder water increases performance, while warmer water decreases performance. Performance may vary slightly depending on brand and model-contact factory.

## MISCELLANEOUS RULES OF THUMB

- To clear condensate from the sump of a Dekatorr pump, run the pump with the inlet closed and the gas ballast open until vaporized (Note: not all pumps are equipped with gas ballasting).
- The term "Pressure" usually refers to absolute pressure (full vacuum =0).
- The term "Vacuum" usually refers to a relative (gauge) pressure (atmospheric pressure $=0$ ).
- Velocity of air through a pipe with a regenerative blower:

$$
\text { Ft. } / \text { Min. }=\frac{576 \times \text { SCFM }}{3.14 \times \text { D }^{2}}
$$

- Maximum pressure drop through a pipe in a system should be about $10 \%$ of the absolute operating pressure, from point of use to the pump, including all devices in the line (A lower pressure drop could mean that you are paying more for the piping; a higher pressure drop could mean that you are paying more for the pump due to oversizing).
- To find a leak in vacuum piping, try placing Saran Wrap ${ }^{\text {TM }}$ (or other "sticky" plastic wrap) around the pipe joints or devices, then watch to see if the wrap draws in tighter due to the leak being sealed or if the pressure changes on the gauge.
- Cooling pumps: The required exchange of air in a room in order to remove heat generated by the pump and keep the room at a temperature $10^{\circ} \mathrm{F}$ above the outside ambient is about 230 CFM/HP.
- For every 18F degrees increase in temperature, oil life is reduced by half.
- It costs about $\$ 333.00$ per year to operate a 1 horsepower pump running $100 \%$ of the time with a cost of $\$ 0.05 / \mathrm{kWh}$.
- 1 PPM (parts per million) is like 1 second in 11.6 days.

1 PPB (parts per billion) is like 1 second in 31.7 years.

- A leak of about 1 drop of oil every 2 minutes $=1$ $\mathrm{cc} / \mathrm{hr}$. $=1$ quart every 39.5 days $=2.3$ gallons/year.
- Surgical tubing makes a good vacuum chuck gasket.
- 1 in. ${ }^{3}$ @ 760 Torr contains about $4.4 \times 10^{21}$ $(4,400,000,000,000,000,000,000)$ molecules; at 1 micron there remain $5.79 \times 10^{15}$ molecules.
- USDA oil ratings:

H1-Incidental contact with food permitted.
H2-No contact with food is permissible.

- A single fingerprint can have a load of 1 x $10^{-15}$ torrol/sec, or $2.12 \times 10^{-5}$ torreCFM ( $2.7 \times 10^{-8}$ SCFM).
- The coldest ambient temperature in which a Becker oil-less pump should be placed is $-5^{\circ} \mathrm{C}$ (23 ${ }^{\circ} \mathrm{F}$ ).
- The capture velocity for fume hoods is about $100 \mathrm{ft} / \mathrm{min}$. ( 1.1 mph ).
- Evaporating water: You will evaporate about $2 / 3$ of your load in about half the total time.
- Condensers should be considered when the partial pressure of the vapor is greater than half the total pressure.
- HVLP (High Volume Low Pressure) paint spraying typically operates between 4.8 and 7.5 PSIG and needs about 20 SCFM at the gun.
- Cost of cooling (air conditioning) to offset heat generated by a pump (per year): $\$ 0.00157 / B H P / h r$. of operation/\$0.01 per kWh
- For each 1 HP of pumps we save, we reduce the power required for air conditioning by 0.2 HP .
- Oral surgery requires 1 SCFM per terminal.
- Dental offices are sized by the number of operators (dentists or hygenists) that may use the equipment at a given time, not the number of suites.
- Compressed air = 1-2 SCFM @ 40 PSIG
- Vacuum = 7.0 SCFM @ 8 in . Hg (min.)
- Skilled nursing facilities require 1 SCFM per bed (due to open terminals).
